Littoral Zone Planting and Aquascaping

Restoring your lakefront can be easy and beneficial

The negative effects of dense growths of exotic and noxious species can have devastating effects on the water quality of your lake. These weeds cause ecologic damage through domination of desirable native species and muck-building which has long-term effects on water quality as well as habitat value and aesthetics. Our website includes "A Homeowners Guide to Lakefront Restoration", written by us, as well as other pertinent information: BiosphereNursery.com.

USE ONLY NATIVE PLANT MATERIAL IN YOUR RESTORATION PROJECT

Most Florida lakes fluctuate on a seasonal basis and native wetland species are adapted to this. Begin your plan by selecting an average normal water level (NWL). Listed below are some appropriate plants for each zone. To view samples of the plants you can visit our nursery or check out our website at BiosphereNursery.com. and click on Lakefront Restoration.

Zone A— Trees: red maple, green ash, loblolly bay, dahoon holly, sweetbay, water hickory and sweet gum

Shrubs: Virginia willow, pipestem, button bush, climbing aster, wax myrtle, and Walters viburnum

Zone B— Bald or pond cypress and blackgum, scarlet hibiscus, soft rush, canna, iris and sand cord grass in upper half of zone (above NWL), Pickerelweed, arrowhead, and maiden cane in lower half of zone, all planted on minimum 2-foot centers

Zone C— Pickerelweed, spikerush, and bulrush— planted on minimum 2-foot centers (required by permits)

Zone D— Bulrush and water lilies
